Social security programs in Japan are designed to guarantee a minimum standard of living and to protect citizens from certain types of social and economic risk. The social security system consists of four major components: public assistance, social insurance, social welfare services, and public health maintenance. With the average age of the Japanese population rising rapidly because of a falling birth rate and increasing life spans, it is inevitable that the total population will soon begin to fall. In this environment, the issues of how to pay for and restrain the growing pension, medical care, and nursing care burden have become critical ones as society seeks to create a humane and sustainable social security system.

Introduction

At the end of the 1950s, the establishment of two laws—the National Health Insurance Law and the National Pension Law—made self-employed persons, those engaged in agriculture, and others with no previous access to social insurance policies eligible for national pensions and national health insurance. Beginning in April 1961, a universal health insurance system and

Development of a Modern Social Security System
pensions for all Japanese citizens were put into effect. This social welfare regime was supported by government financial resources, which were adequate under the prevailing conditions of rapid economic growth. Steadily, it developed as the basic system underpinning the people’s welfare. In 1973, a time some people called the “First Year of the Welfare Era,” a revision of the Welfare Law for the Aged eliminated healthcare fees for older citizens, while a revision of national health insurance regulations boosted the percentage of national coverage for family medical expenses. Revised national pension regulations raised pension levels and introduced a sliding scale (reflecting changes in commodity prices) that benefited, in particular, the neediest recipients.

With the oil crises of 1973 and 1979, Japan entered an era of welfare constraints. In 1983, the Health and Medical Service Law for the Aged was enacted. This law mandated that the cost of geriatric medical treatment should be covered not only by National Health Insurance but by employee, cooperative, and other health insurance plans in order to reduce the national treasury’s outlays for the National Health Insurance Plan. Moreover, senior citizens themselves were to pay a fixed price for medical treatment. In April 1986, a new pension system was inaugurated. This pension reform aimed, above all, to establish a system that could be maintained under the conditions of Japan’s aging society.

Japan’s social security benefits came to ¥112.1 trillion in fiscal 2014, or ¥882,100 per capita, an amount that has risen in pace with the rapid aging of the population. Pensions accounted for 48.5% of the total, medical spending for 32.4%, and welfare and other expenses for 19.1%. Social security benefits for the elderly came to ¥75.6 trillion, or about 68.1% of the total.

In terms of government spending, social security related outlays made up ¥26.4 trillion of the fiscal 2011 budget and 27.9% of all expenditures in the general account budget. The proportion, however, rises to 41.3%, nearly 50% when government bond-related expenses and local government subsidies are excluded. The ratio, which was 26.7% in fiscal 1980, has exceeded 40% since fiscal 1999, reflecting the rapid increase in the number of elderly people.

Concerns about the graying of the population first surfaced in 1994, when the ratio of elderly people surpassed 14%. Around the same time, the number of children also began declining conspicuously. In 2005 the total fertility rate hit a record low of 1.26. Since then the rate has risen slightly but remains low. The upshot of this trend will be a marked decline in the ratio of people of productive ages, from 15 years to 64 years of age, to elderly person 65 years of age or older, from 4.4 in 1995 to a projected 2.1 in 2025.

Pension System

Given the rapid aging of society and the fact that there will soon be a downward population trend due to the dropping birth rate, social security systems, including pensions, need to be reexamined. As already mentioned, in 1961 a system was put into effect whereby all Japanese citizens could receive pensions. These pensions were of three types: the “national pension” (kokumin nenkin) for self-employed persons, “employees’ pensions” (kosei nenkin) for salaried persons, and “mutual aid pensions” (kyosai nenkin) for civil servants. Then, beginning in 1986, a two-tier pension system was established whereby the entire population is eligible to receive a national pension, to which employees’ pensions and mutual aid pensions are added for those people eligible.

Thus, at present, the first tier of the two-tier pension system is the national pension, to which people contribute between ages 20 and
recipients were cut by 5%, and the wage-slide system was frozen, with adjustments being made only based on consumer price index changes. In addition, the age at which employees’ pension benefits are received is being raised from 60 to 65. It already rose to 61 in 2013 for men and in 2018 for women, followed by subsequent one-year increases made every three years. The final level of age 65 will be reached in 2025 for men and 2030 for women. Pension system reform measures passed in 2004 raised the pension contribution amounts for both the national pension and employee’s pensions, and specified the raising of the ratio of the national pension financing burden borne by the national treasury from one-third to one-half by 2009.

The Ministry of Health, Labour and Welfare has released a “balance sheet” showing estimated pension revenue and expenditures through the year 2100. These estimates have projected that a large revenue shortfall will develop. This being the case, if Japan’s birthrate continues to drop as expected, the government could be hard pressed to maintain the currently promised pension system benefit levels.

As the average age of the population increases, the number of elderly requiring long-term care is growing rapidly. At the same time the percentage of the elderly living with younger family members, while still high compared to many other countries, is falling, and the average age of family caregivers is increasing. As of 2016 approximately 6.3 million people had been officially recognized as requiring long-term care.

In an attempt to address the care needs of such people, in 1997 the Diet passed the Long-Term Care Insurance Law, which led to the creation of a nursing care insurance system for the elderly in 2000. This system...
collects obligatory insurance contributions from a broad sector of the population (all persons aged 40 or older) and provides such services as home visits by home helpers, visits to care centers, or long-term stays in nursing homes for older persons suffering from senile dementia or confined to bed for health reasons. In each individual case, the need for such services has to be certified by city, town, and village offices in charge of administering the nursing care insurance system. Insurance contributions from persons aged 65 and over (“Type 1 insured persons”) are collected by the local administrations in the form of deductions from these persons’ pensions, while contributions from “Type 2 insured persons” between the ages of 40 and 64 are collected together with health insurance contributions as a lump sum.

Beneficiaries of the system must be at least 40 years old and must pay, in addition to the regular insurance contributions, 10% of the cost of services received. The financing for Japan’s nursing care insurance system comes 25% from the national government, 12.5% each from prefectural and local governments, and 50% from insurance contributions.

A 2005 revision to the Long-Term Care Insurance Law added an emphasis on prevention aimed at helping those with relatively mild problems to maintain and improve their conditions, and thereby avoid deteriorating to the point where extensive care is necessary. This preventive care management is handled by community-based comprehensive support centers.
